Theory of Timebirth

The Timebirth theory proposes that before matter, energy, or space existed, time flowed in a uniform, uneventful state.

The origin of the universe was not a Big Bang in the classical sense, but rather a disruption-a ripple-in this perfectly smooth temporal flow.

This irregularity marked the beginning of difference: space emerged, energy appeared, and matter formed.

Perhaps our consciousness, and each moment we perceive, are echoes of that initial ripple-countless miniature Big Bangs in the flow of time.

In this view, existence itself is a distortion of perfect time, and awareness is a reverberation of its first rupture.
